

Super Pipe Solution

The Solutions:

John Alexander Consulting (JAC) is a strategic carrier and cloud neutral consulting firm that partners with Momentum to deliver a multitude of solutions inclusive of the Super Pipe product. JAC designs their customers topology at the macro level rather than one solution at a time. Coining the service, Pivotal Technology, JAC is one of our top global partners.

The Momentum Super Pipe is a large telecom loop with capacity to host multiple interface types, ultimately saving on cross connect and port costs because of it's one single port. This solution provides businesses with a single gateway to the cloud, significantly reducing network requirements. One pipe, 10 MB - 10 GB, partitioned to meet all connectivity needs.

- Multiple interface types, 1 Gig, 10 Gig, 100 Gig, Multi vlans
- Internet, Ethernet WAN - Metro, Domestic and International, Cloud Connect
- LAG options available

"Momentum and I have worked closely with JAC over the years and I have seen first hand that they are true experts in their field. We are grateful for their partnership and their dedication to providing the best solutions for their customers!"

-Ande Hornig

Why JAC Chooses Super Pipe:

Secure application delivery is at the cornerstone of JAC's topology designs. By implementing the Super Pipe provided by Momentum, JAC is able to quickly and economically segment portions of a circuit for multiple connectivity in which one "super" circuit can deliver data, express routes to hyperscalers and other critical services. The use of the Super Pipe ensures JAC's clients have one fast, reliable, scalable, and secure network.

JAC is particularly experienced in managing technology stacks for global holding firms and other companies with highly acquisitive and digestive requirements. With Momentum's Super Pipe, JAC can confidentiality install a technology that meets the current application demands but also allows the client to quickly alter the segmentations for their ever-changing business needs. This pivotal functionality is paramount to future proofing JAC's clients' environments and reducing security concerns for private secure transport of applications.

Over the years, JAC and Ande Hornig, Network Access EVP of Momentum, have collaborated on solutions at the highest level working in partnership with clients' in-house technology teams. JAC has many clients who access the Super Pipe in their colocations for layer 2 connectivity, layer 1 for site internet access, and layer 3 for access to the regional Microsoft cloud for the azure replication needs.
